

Developing future fuels for sustainable flights

As an innovative provider of integrated energy solutions and a leader in the UK's decarbonisation journey, our aviation customers can rely on Essar to help them achieve their energy transition objectives.

Essar's Stanlow Manufacturing Complex is already one of the most technically advanced refineries in Europe. And with over \$1bn worth of strategic investments, we're not only making it the UK's first low carbon refinery but also home to the UK's largest bulk liquid storage and bio-fuels hub.

As one of the largest manufacturers of aviation fuels in Europe, we supply our high-quality jet fuels to the aviation sector, on both a wholesale and direct-to-plane basis via our road terminals, direct pipelines to Manchester Airport, and also via the UK Oil Pipeline (UKOP) network to the Midlands and South East regions.

At Essar, we understand that society's demands are changing and as a UK manufacturer, we are focussed on meeting the current and future needs of British industry and consumers.

We recognise the importance of providing a resilient supply chain of high-quality, low carbon products and we develop long-term partnerships based on value, innovation and trust.

We've also joined forces with Fulcrum BioEnergy Limited to create a new facility to convert non-recyclable household waste into sustainable aviation fuel for use by airlines operating at UK airports. And our partner company, Stanlow Terminals Limited, is also developing the UK's largest independent bio-fuels storage capacity.
